Dear Pedro,

The ECG data originate from the Akershus Cardiac Examination 2 (ACE2) Study, that has previously been approved with REC#15194. We recently applied for extension for the project, and it is now approved until March 2026. In the original consent form, we have approval to use baseline data from the admission due to acute dyspnea, including echocardiography and ECG data. Attached are the original REC approval, REC approval for project extension and the informed consent.

Ahus is the responsible research institution for this project, and for all collaborations with OsloMet as long as we are using patient data collected at Ahus.

Best regards,

Magnus
